Abstract of DE 20313350 (U1)

The matchboard (1) has a groove (8) and tongue (9) on one end side (6,7) for engaging in a mating profiling on the end side of another matchboard with a preferably identical cross section. At least one profiling is installed or constructed in such a way that despite the engagement of this profiling adjoining matchboards can camber in a limited fashion in their longitudinal direction in relation to each other. The profiling is designed in such a way that a play-conditioned inter-engagement of the profiling is made possible.
